Class 8: Breast Cancer Mini Project

Dani Baur (A16648266)

About

In today's lab we will work with fine needle aspiration (FNA) of breast mass data from the University of Wisconsin.

1. Exploratory Data Analysis

```
# data input
fna.data <- "WisconsinCancer.csv"
wisc.df <- read.csv(fna.data, row.names=1)
head(wisc.df)</pre>
```

```

[1] 10

Before analysis I want to take out the expert diagnoses column (aka the answer) from our dataset.

```
head(diagnosis)

[1] M M M M M M

Levels: B M

# We can use -1 here to remove the first column
```

diagnosis <- as.factor(wisc.df\$diagnosis)</pre>

2. Principal Component Analysis

wisc.data <- wisc.df[,-1]</pre>

We can try a kmeans() clustering first

```
km <- kmeans(wisc.data, centers=2)
km$cluster</pre>
```

```
table(km$cluster)
```

1 2 131 438

Cross-table:

```
table(km$cluster, diagnosis)
```

diagnosis

B M
1 1 130
2 356 82

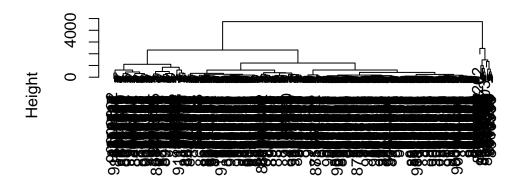

Let's try hclust() the key input required for hclust() is a distance matrix as produced by the dist() function.

```
hc <- hclust(dist(wisc.data))</pre>
```

I can make a tree like figure:

plot(hc)

Cluster Dendrogram

dist(wisc.data) hclust (*, "complete")

Do we need to scale the data?

We can look at the sd of each column (original value)

round(apply(wisc.data, 2, sd))

radius_mean	texture_mean	perimeter_mean
4	4	24
area_mean	smoothness_mean	compactness_mean
352	0	0
${\tt concavity_mean}$	concave.points_mean	${\tt symmetry_mean}$
0	0	0
${\tt fractal_dimension_mean}$	radius_se	texture_se
0	0	1
perimeter_se	area_se	smoothness_se
2	45	0
compactness_se	concavity_se	concave.points_se
0	0	0
symmetry_se	fractal_dimension_se	radius_worst
0	0	5
texture_worst	perimeter_worst	area_worst
6	34	569

```
smoothness_worst compactness_worst concavity_worst
0 0 0

concave.points_worst symmetry_worst fractal_dimension_worst
0 0 0
```

Yes, we need to scale. We will run prcomp() with scale=TRUE.

```
wisc.pr <- prcomp(wisc.data, scale=TRUE)
summary(wisc.pr)</pre>
```

Importance of components:

Generate our main PCA plot (score plot, PC1 vs. PC2 plot)...

```
library(ggplot2)

res <- as.data.frame(wisc.pr$x)

ggplot(res) +
   aes (x=PC1, y=PC2, col=diagnosis) +
   geom_point()</pre>
```

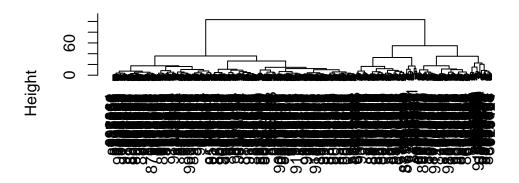

5. Clusting on PCA Results

Using the minimum number of principal components required to describe at least 90% of the variability in the data, create a hierarchical clustering model with the linkage method="ward.D2". We use Ward's criterion here because it is based on multidimensional variance like principal components analysis. Assign the results to wisc.pr.hclust.

```
d <- dist(wisc.pr$x[,1:3])
hc <- hclust(d, method="ward.D2")
plot(hc)</pre>
```

Cluster Dendrogram

d hclust (*, "ward.D2")

To get my clustering result/membership vector I need to "cut" the tree with the ${\tt cutree}$ () function.

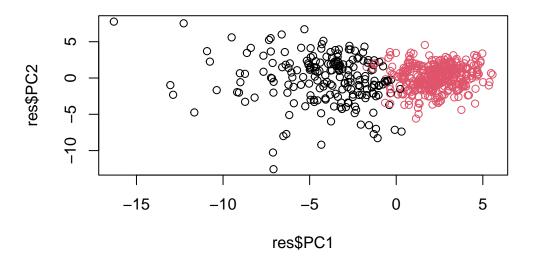

```
grps <- cutree(hc, h=80)</pre>
```

Q. How many patients are in each cluster group?

```
table(grps)
```

```
grps
1 2
203 366
```

```
plot(res$PC1, res$PC2, col=grps)
```

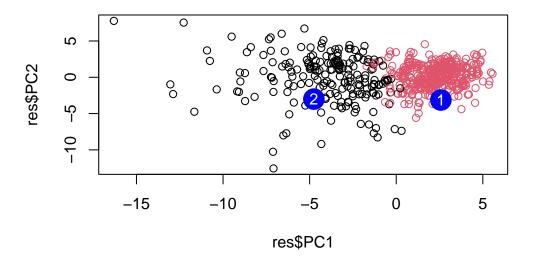

7. Prediction

We can use our PCA result (model) to do predictions, that is take new unseen data and project it onto our new PC variables.

```
#url <- "new_samples.csv"
url <- "https://tinyurl.com/new-samples-CSV"
new <- read.csv(url)
npc <- predict(wisc.pr, newdata=new)
npc</pre>
```

```

Q18. which of these new patients should we prioritize for follow up based on your results? We should prioritize patient 2 since the prediction shows similarity to the malignant results.

Summary

Principal Component Analysis (PCA) is a super useful method for analyzing large datasets. It works by finding new variables (PCs) that capture the most variance from the original variables in your dataset.
